

Whether you need a custom e-commerce application, database integration, a member portal, or an intranet/extranet application, our team of Web programmers has the technical expertise and practical experience to create the right solution.

.NET Web Programming:

We specialize in programming custom Web applications for a variety of platforms and languages, and we also do .NET development. In fact, we have a project team dedicated to developing custom Web applications in Microsoft's .NET Development Platform. This platform offers many advantages over traditional Web programming platforms, including increased application speed and response time, improved reusability of programming code and easier integration with other applications.

.NET Application Development:

We have done many high-profile, mission-critical .NET Web application development projects for organizations such as Sinoquebec, MCS-Servo, Dish Satellite Network, Chinese Family Service Center in Greater Montreal and several government entities.

When we develop a custom Web application, we implement the latest encryption technology to make sure all data is secure. We can implement different user access levels and other security measures to ensure your Web application is as secure as it is functional. It's all part of our .NET development.

Our experienced Web programming team can custom tailor a Web application to meet your exact specifications and provide the best solution for your organization. To learn more about how we can help you, please contact us. Also ask us about content management and how we can integrate a custom content management system into your website or Web application.
